ABSTRACT OF THE DISCLOSURE

A motor vehicle with a movable convertible top includes a control device for controlling a convertible top motion and a device for the recognition of the convertible top position. The device for convertible top position recognition
5 continuously monitors the position of the convertible top. The position of a defined element of the convertible top is determined by means of at least one acceleration sensor that measures the current acceleration in relationship to the acceleration of free fall.

SummaryVehicle with a movable convertible top

5

The invention relates to a motor vehicle with a movable convertible top, whereby a control device for controlling a convertible top motion and a device for the recognition of the convertible top position are provided. The device for convertible top position recognition continuously monitors the position of the convertible top, whereby

10

the position of a defined element of the convertible top is determined by means of at least one acceleration sensor that measures the current acceleration in relationship to the acceleration of free fall.
